A triac is very similar to a thyristor, with the difference that it can conduct in both directions. It has three electrodes, called anode 1 (A1), anode 2 (A2), and gate (G). It is used for regulation of alternating current circuits. Devices such as hand drills or globes can be controlled with a triac.

A Thyristors is a four-layered semiconductor rectifier also known as a Bistable. They are commonly used in the creation of latching circuits. We supply SCR, TRIAC and DIAC/SIDAC Thyristors suitable for a wide range of project types, all available for rapid shipping.

Issue date September 1995 Document number 9397 750 00316 Hi-Com triacs from Philips Semiconductors are specifically designed to give superior triac commutation performance in the control of motors for domestic equipment and tools. These devices are suitable for use with a wide variety of motor and inductive loads without the need for a snubber.

Product Overview The BTA24-600BWRG is a 3-pin Insulated Triac, suitable for general purpose mains power AC switching. It features high current, low thermal resistance with clip bonding and high commutation (4 quadrant) or very high commutation (3 quadrant) capability, 4A Peak gate current

BTA24-600BWRG Stmicroelectronics, Triac, 600 V, 24 A | Farnell  
A triac is a bidirectional thyristor. It incorporates two thyristors in a single chip device and the complete unit is controlled by one gate. It has two terminal and a gate. Thyristor is most suitable for control of inductive circuits such as motors. Triacs, being bidirectional, have lesser dv/dt capability compared to thyristor.

What is the main difference between Triac and thyristor ...  
A thyristor is a solid-state semiconductor device with four layers of alternating P- and N-type materials. It acts exclusively as a bistable switch, conducting when the gate receives a current trigger, and continuing to conduct until the voltage across the device is reversed biased, or until the voltage is removed. There are two designs, differing in what triggers the conducting state. In a three-lead thyristor, a small current on its Gate lead controls the larger current of the Anode to Cathode

Thyristors Thyristors are a class of semiconductor devices characterized by 4-layers of alternating p and n material. Four-layer devices act as either open or closed switches; for this reason, they are most frequently used in control applications. Some thyristors and their symbols are (s) 4-layer diode (b) SCR (c) Diac (d) Triac (e) SCS

The thyristors are designed for use as semiconductor switches in appliances and equipment powered by line AC voltages up to 250 V RMS. Available in five compact, surface-mount and through-hole packages, these components expand the Source: Littelfuse Inc. Littelfuse TRIAC product line by making high 150 ° C maximum junction temperature devices available in 600 V to 800 V with ratings of 12 A, 16 A, 25 A, 30 A and 40 A.

High-temperature TRIAC thyristor series helps designers ...  
Thyristors can be described as the equivalent of a diode in series with an electrical switch without any moving parts. Triacs can be thought of as two Thyristors placed back to back. Triacs are electrical devices used for controlling electrical current between two terminals depending on the device being controlled.
